

I have a real interest in how computers interact with the world, I want to see them do more than just talk to servers and run programs, I want to see them interact with the world they are in. AI has already made robots wash dishes and adapt to their own form changing, I want to learn not only how they do that but make it so they can do more, if robots can make someone's life better, then I want to be a driving force for that. Seeing AI grow so quickly in both integration with systems, and in uses, makes me think there must be a way to use it that someone hasn't thought of, which is why I want to learn to integrate it into systems and configure them for anything you need. Robotics and AI are still new and there is still so much to learn about and do with them not only for me, but for everyone, and knowing that it makes me want to be on that team who find out and do everything left to still do. I have always had an interest in tech and hardware, not just from a physical point but in developing and working with hardware from a programming point, it's something I enjoy and want to learn more about. Technology is something I want to do for my entire life, and I want that to be in Robotics and AI.

In my study's I have learnt how to use multiple programming languages like Python including; Pandas MatPlotLib and kivy libraries, C# for back-end web development and basic PHP with several development lifecycles like agile and waterfall as part of my Software development T-level. I have, and still am, learning object orientated programming and how to work with and collect data like from an API or similar. I currently have an industry placement at AMCOGiffen with the IT department as part of my course where I am learning networking and how a real business environment works. My placement also gives me opportunity to learn about automation for business as part of my role where I make processes more efficient and reduce workload. I spent some time with a different industry placement doing mobile app development, working with input from the camera to scan a QR code. I

have spent a lot of academic time learning the fundamentals of computer systems and how they are used which has given me a good starting point for learning and working with anything new.

Outside of my course I am a member of the Executive student committee at Barnsley college and hold the role of sustainability officer which was a student voted position. This has given me opportunities that I never would have had otherwise as well as responsibilities to stand for the student's words and wishes. I have been able to go to London on a guided tour of parliament and have the ability to work with college management to run events and campaigns related to my role. I am currently working on an E-waste event designed to teach people what to do with their old tech, how to make it fit a new purpose and how to get rid of devices properly. I am also working on a campaign to teach people the environmental impacts of using AI assistants and the resources it uses. I have had the chance to visit London again to be part of a T-level conference and speak to the creators of the qualification about my experiences and what I have learnt with industry members and the Department of Education. I personally have experience using many different Linux distribution like Arch; Manjaro and EndeavorOS and Debian; Ubuntu and Mint among others so Linux is familiar to me including tools like ssh which I have used to set up a basic RasPi5 NAS which I used ssh to control and configure with open OpenMediaVault. I have configured and built my own PC to local host apps and websites I have created, one of which being a controller app for LED lights in my room where the original controller broke, another being a website I made to act as a bookmark site and is set as default on all my browsers.
